

1. "Any modern advanced technology is does not different from magic".
2. This quote by Artur Clark perfectly describes modern computers.
3. Today computers are used almost everywhere: in education, business and everyday life.
4. **In this monologue**, I will talk about the history of computing and describe supercomputers.

2

1. First of all, in order to accomplish a task, a computer uses hardware and software.
2. Hardware includes processor and memory.
3. Several components make up the central processing unit, which is the main part of the computer.
4. Computers perform calculations using special programs.
5. Before working with a computer, users usually turn on a hardware device and install a program on the computer.

1. When a user works with a computer, hardware and software operate together.
2. First, the user provides the input using a keyboard or mouse.
3. For example, a person may click on the icon or enter a command to start a program.
4. Then the computer hardware receives commands from computer software and performs operations.

3

1. **In the past**, computers were very large machines.
 2. **Later**, computers became smaller and could **fit on one's desktop**.
 3. **Over time**, computers **evolved from a cumbersome and slow device to a quick and smart machine**.
 4. Charles Babbage invented the computer by creating the first programmable mechanical device.
 5. These machines were designed **to complete calculations**.
-
1. Today, personal computers are compact and powerful devices.
 2. My computer easily fits on one's desktop and helps me study.
 3. I often use it to perform calculations and search information on the Internet.
 4. Modern computers have incredible processing power.

4

1. However, some tasks require much more powerful machines.
2. A supercomputer is the most powerful type of computer.
3. Engineers develop transistors and integrated circuits to improve computer performance.
4. Supercomputers are capable of crunching a complex problem faster than default computers.

1. First, supercomputers take in information by input and then generate output.
2. Unlike default computers, they use parallel processing.
3. As a result, the computer can use much of processing power effectively.

5

1. In my opinion, the future of computers will be very exciting.
2. Scientists continue to develop new technologies and improve computer systems.
3. They will help people solve complex problems in science, medicine and engineering.

6

1. To conclude, computers help people accomplish tasks and process information quickly.
2. Supercomputers solve complex scientific problems using modern technologies.
